

Outline

Thesis Statement:

I believe that the internet should be accessible to students below the age of eighteen, as it assists in ensuring effective learning and broadening the horizon of mind.

Reason 1:

It ensures effective learning

Sub-idea a: abounds in resources

Sub-idea b: ensures technoliteracy

Reason 2:

It broadens the horizon of the mind

Sub-idea a: offers content beyond the syllabus

Sub-idea b: provides space to express thoughts

Counter Argument:

People might say that the internet has inappropriate contents

Refutation:

We can take precautionary measures by arranging adult supervision

Conclusion:

- Better performance in academic career
- Knowledge beyond textbooks
- Use of the internet should be encouraged

The Internet Should Not Be Accessible to Students Below Eighteen Years of Age

The civilized world is entangled in the mesh of the internet. From education to entertainment, the involvement of the internet is undeniable. It can contribute to upgrading people's lives irrespective of their age. Therefore, I believe that the internet should be accessible to students below the age of eighteen, as it assists in ensuring effective learning and broadening the horizon of mind.

Firstly, the internet can help in confirming that the lessons learnt by the young students are leaving an adequate impact on them. Since the internet abounds in resources, students can utilize those to ensure better understanding. For instance, textbooks often lack sufficient information. In this case, they can browse the internet for richer contents. Another advantage is that it ensures technoliteracy. In many underdeveloped and developing countries, teachers are reluctant to use technology. As a result, in the pandemic stricken world where most affairs of daily life including academic work have shifted online, many educational institutions face serious challenges. Therefore, to ensure a better future, the students must be knowledgeable and techno literate.

Secondly, the internet can play a massive role in broadening the horizon of the students' mind. As it offers content beyond the syllabus, students can get inspired to seek knowledge without limit. For example, the scope of developing diverse skills in educational institutions is often limited. If students are allowed to use the internet, they will be able to discover and utilize their potential. Besides, internet allows people to express their opinions. To give an example, students can share their thoughts regarding something in a textbook and consider the ideas of others, and thus learn tolerance. In this way, through exploring diverse fields and beliefs, students can develop deep insight.

On the contrary, some people might argue that children should not be allowed to use the internet as it is filled with inappropriate materials. As an example, they might say that the internet allows easy access to violent, disturbing, and pornographic content.

However, I think that it is irrational to deny internet access to students due to this because it is possible to take precautionary measures. For example, there are browser extensions that automatically block any age inappropriate content while one surfs the internet. **Moreover**, children can be asked to use the internet under adult supervision. If it is impossible, parents can install software.

In conclusion, the wise use of the internet can lead young students to perform better in their academic career. Besides, it also allows them to seek knowledge beyond textbooks. Therefore, students under eighteen years of age should not only be allowed but also be encouraged to use the internet.
